STRATUM Introduction

STRATUM (Street Tree Resource Analysis Tool for Urban-Forest Managers) is an easy-to-use, computer-based tool that will enable the City of Richmond to assess its street tree resource. This assessment will assist the Urban Forestry Division to foster support for their program, secure funding, and provide baseline data to improve management of the Urban Forestry Division. STRATUM calculated the following aspects of the street tree resource:

- Structure (e.g., species composition, age distribution, canopy cover)
- Function (environmental and aesthetic benefits)
- Value (annual monetary value of benefits and costs)
- Management Needs (e.g., recommended maintenance, stocking levels, tree conflicts)

Reports were produced for the entire city, for management zones (Council Districts), and by tree type and species when applicable. STRATUM used the regional tree growth models and regional default costs and benefits.

A sample inventory of 4% of the City's street segments was completed to obtain and analyze the data in this report. STRATUM analysis shall provide the City of Richmond with quantifiable justification for the Urban Forestry Division's tree program. The UFD may want to use this data to preserve existing trees or increase its budget.

The STRATUM report confirms the most important question related to UFD tree program: *The accrued benefits of the City of Richmond street trees definitely outweigh their management costs.*

STRATUM quantifies the following benefits in this report:

- Energy conservation
- Air quality improvement
- Carbon dioxide reduction
- Stormwater runoff reduction
- Property value increase

In addition, STRATUM will help the City of Richmond Urban Forestry Division:

- Improve the return on your investment dollar by determining which tree species maximize canopy cover and provide the benefits that are important to your community.
- Determine the management needs of your urban forest to maintain and improve the trees' health.
- Leverage investment from partners for such things as carbon credits or energy conservation.
- Gain public support by demonstrating the value of trees to the quality of life in your community.
- Perform economic evaluations of tree performance using annual budget and expenditure data.
- Assess costs of management - rather than benefits alone - to provide a platform for strategic planning.

Designed to be flexible and adaptive, STRATUM is not GIS-based and requires only basic inventory data; however a GIS shape file was included for the Urban Forestry Division to import into ARC-GIS.

State-of-the-art research provides the scientific foundation for STRATUM's economic reports. Data on the benefits and costs of maintaining street trees come from extensive field research and laboratory modeling for each of 16 national climate regions. STRATUM can be used to assist you in developing policy, setting priorities, and making decisions about your urban forest.

City Defined

The following data was used to define the City of Richmond for STRATUM analysis. Manipulation of these numbers would make changes in the STRATUM output reports and could therefore be used as a management tool for the Urban Forestry Division.

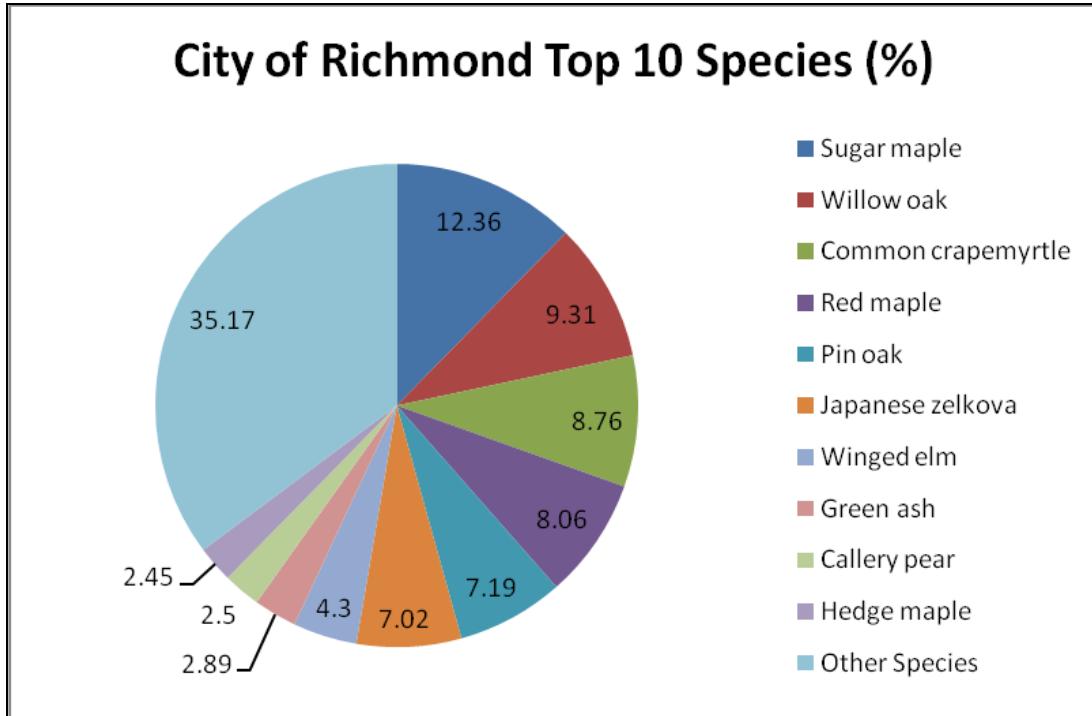

Define City	Amount
Total Municipal Budget (\$)	\$ 650,000,000.00
Population	200,000
Total Land Area (sq mi)	62
Average Street Width (ft)	50
Average Sidewalk Width (ft)	6
Total Linear Miles of Street (mile)	1858

Defined Urban Forestry Costs	Amount
Annual Planting	\$ 250,000.00
Annual Pruning	\$ 593,700.00
Annual Tree and Stump Removal and Disposal	\$ 890,550.00
Annual Pest and Disease Control (\$)	\$ -
Annual Establishment/Irrigation (\$)	\$ -
Annual Price of Repair/mitigation of Infrastructure Damage (\$)	\$ 560,000.00
Annual Price of Litter/Storm Clean-up (\$)	\$ 494,750.00
Average annual Litigation and Settlement due to Tree-Related Claims (\$)	\$ 20,000.00
Annual Expenditure for Program Administration (\$)	\$ 200,000.00
Annual Expenditure for Inspection/Answer Service Requests (\$)	\$ 210,000.00

Findings

- Estimated number of street tree sites was approximately 84,000.
- There were a total number of 80 different species inventoried.
- 10 species counted for approximately 65% of the trees inventoried and 70 species accounted for only 35% of the street tree population.
- Total Citywide Tree Inventory replacement value: \$211,514,285.51.
- Seven species of trees represent 57% of the street trees in the City of Richmond
- 88% of the foliage in all trees inventoried was either in good or fair condition
- 75% of the woody portion of the trees inventoried was either in good or fair condition

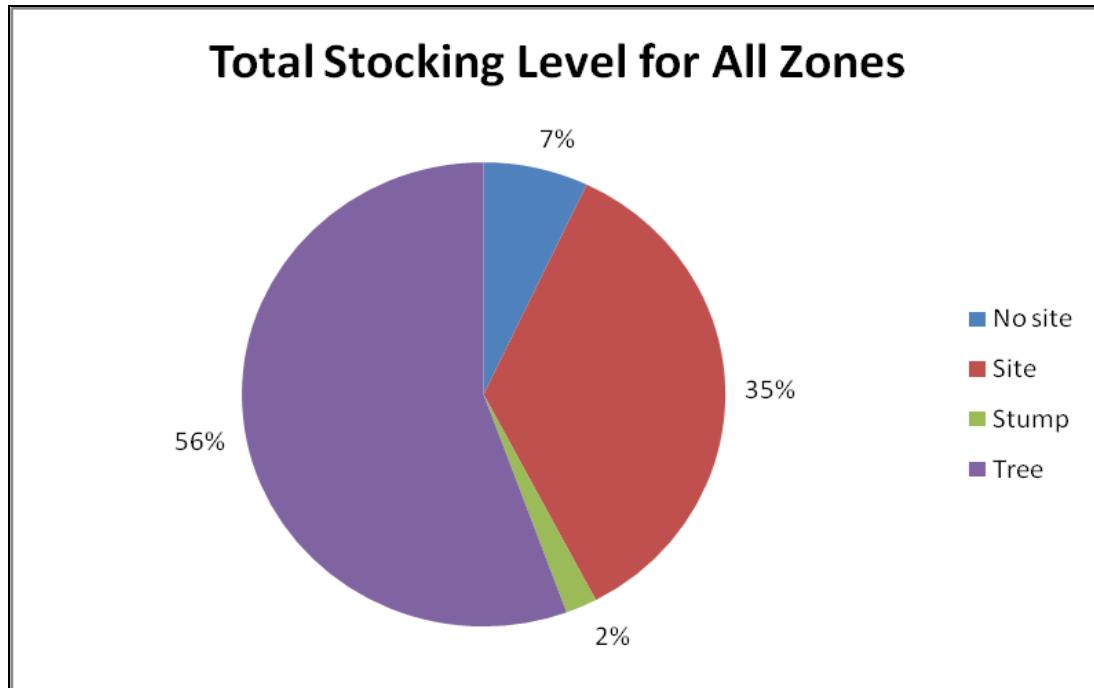

Species Distribution:

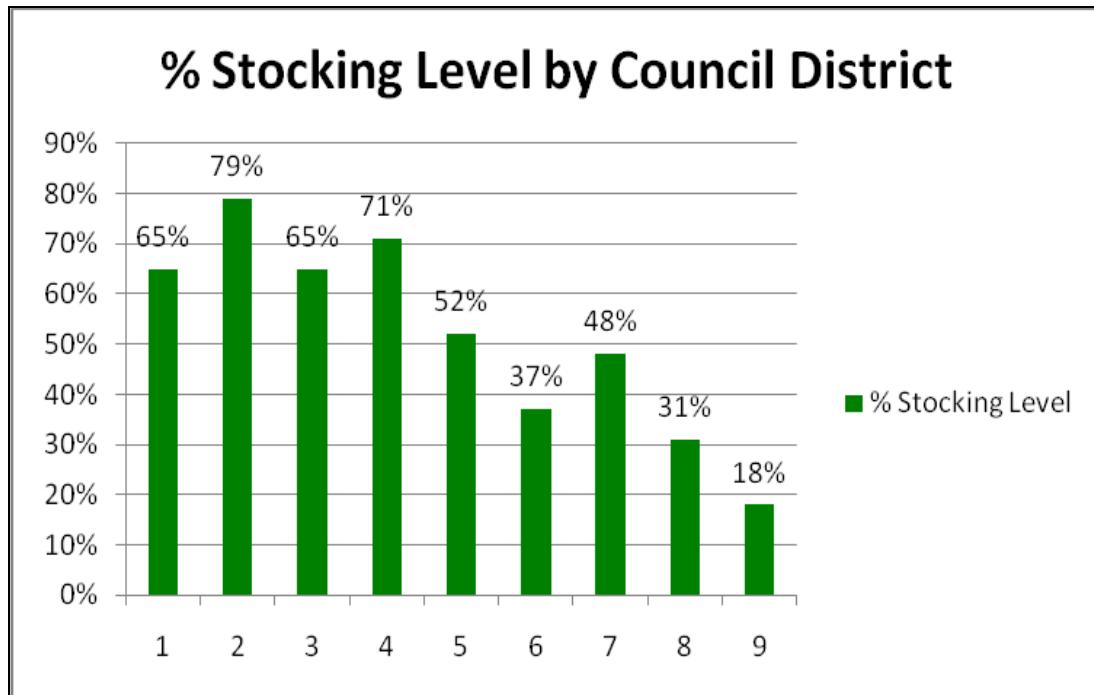

The above Chart was adapted from Appendix 2 which shows the species distribution for the top 10 species inventoried during the Stratum Analysis. It also shows that the seven species of trees represent 57% of the street trees in the City of Richmond. The seven species are represented by only four tree families (*Aceraceae* – maples, *Fagaceae* – oaks, *Lythraceae* – crapemyrtles, and *Ulmaceae* – elms) and only five genera (*Acer*, *Quercus*, *Lagerstroemia*, *Zelkova*, and *Ulmus*). This type of information will be beneficial for Urban Forestry Managers for species recommendations for future planting projects and to help determine the economic or resource impact of a plant pest or disease that has a specific family or genus host.

For Example: In the United States the Asian Longhorned beetle (ALB) prefers maple species (*Acer spp.*), including boxelder, Norway, red, silver, and sugar maples. Currently, the only effective means to eliminate ALB is to remove infested trees and destroy them by chipping or burning. (Appendix 47). This could be a very big problem for the City's Urban Forest since maple species account for 14.5% of the tree inventory for the entire city, and about 28% for Zone 2, and 24% for Zone 3.

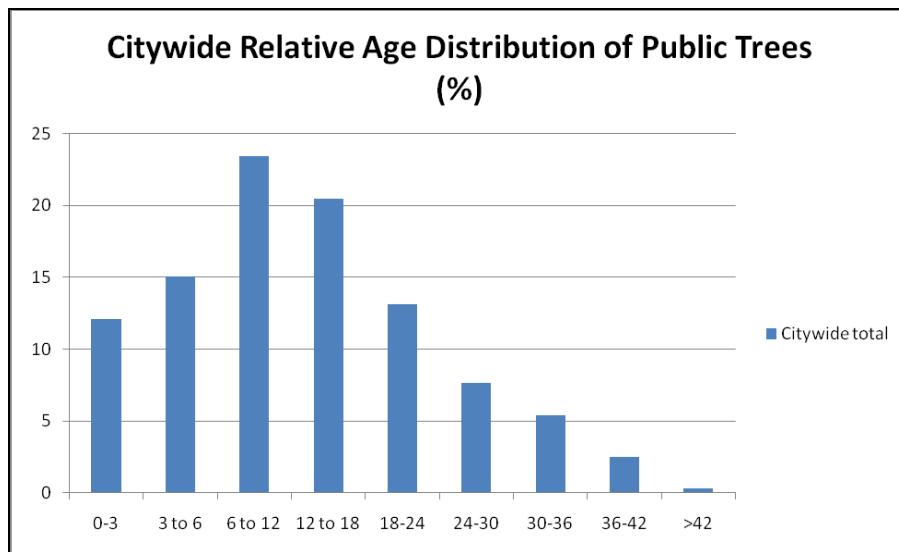

Planting Locations:

Stocking level for all zones is 56%; however, it is greater in areas of the City that have been designed for street trees. For example, Council District 1 has a stocking level of 65%, Council District 2 has a stocking level of 79%, Council District 3 has a stocking level of 65%, and Council District 4 has a stocking level of 71% see chart 2 below). In contrast, it appears that Council District 9 has a low stocking level of only 18%, but this area of the City is mostly road right-of-ways and does not have the design or locations for street trees.

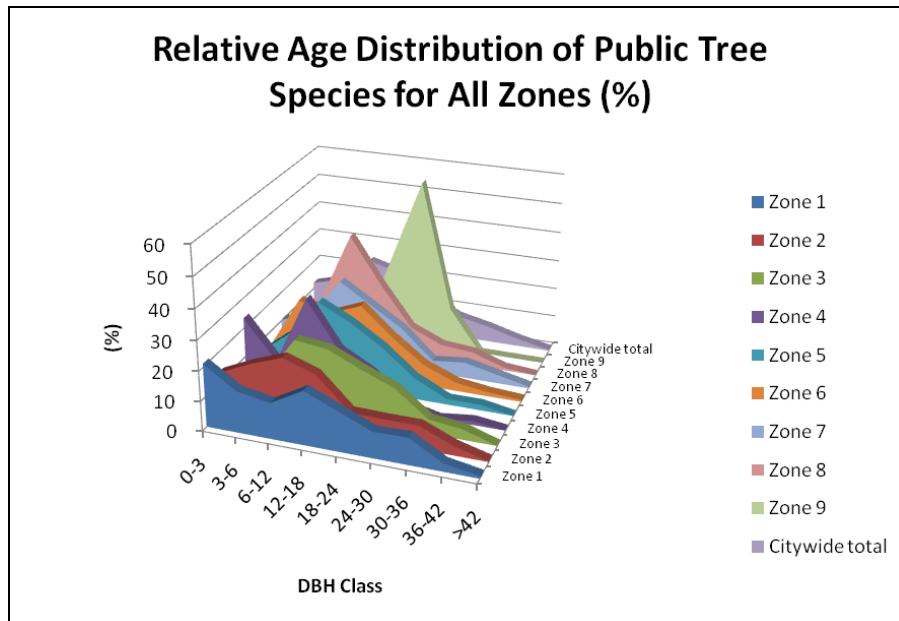

Age Structure:

50% of the existing City Street Trees are 12 inches in diameter or less and 70% are 18 inches or less. It appears in the graph below that inventory shows few small diameter trees, which should indicate that the Urban Forestry Division's Management may concentrate on planting new trees until size classes even off.

The Inventory also shows that there are few larger diameter trees. This may mean the City should plant more trees that mature at larger sizes and the Urban Forestry Division's Management Plan may concentrate on planting trees from larger maturing tree species. There is another possibility that there are current practices with repairs of sidewalks and utilities that may be causing our mature tree numbers to decline.

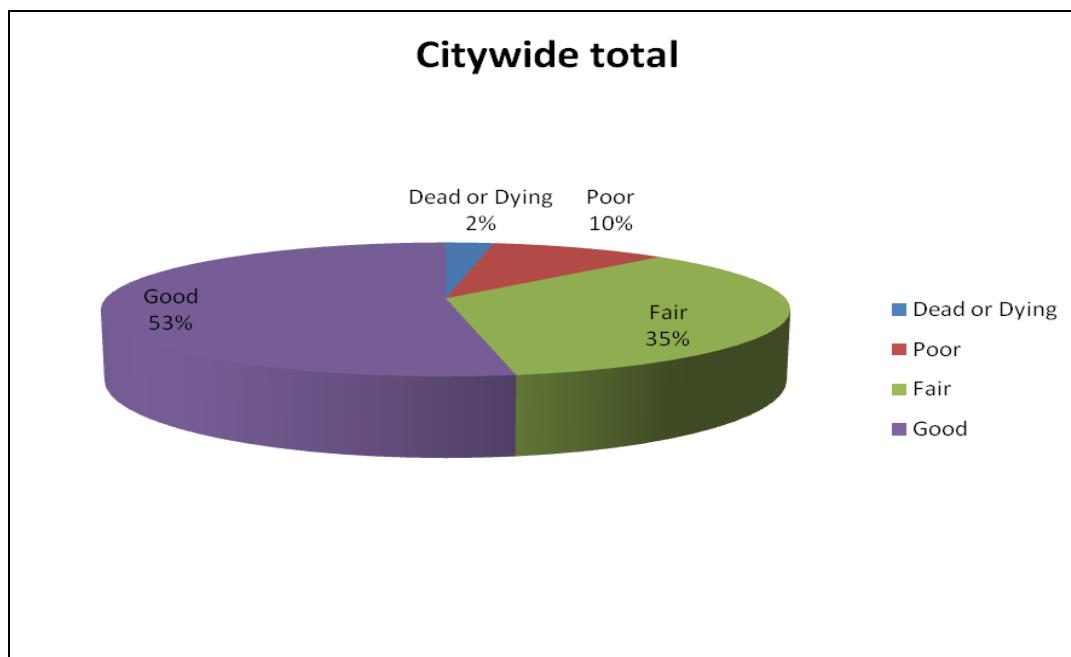

Condition Assessment:

In this inventory Good trees were defined as healthy, vigorous, without signs of insect, disease, or mechanical injury, and they require little or no corrective work. Fair trees are in average condition and vigor for the area, and may be in need of some minor corrective pruning or repair. They may show minor insect injury, disease, or other problems.

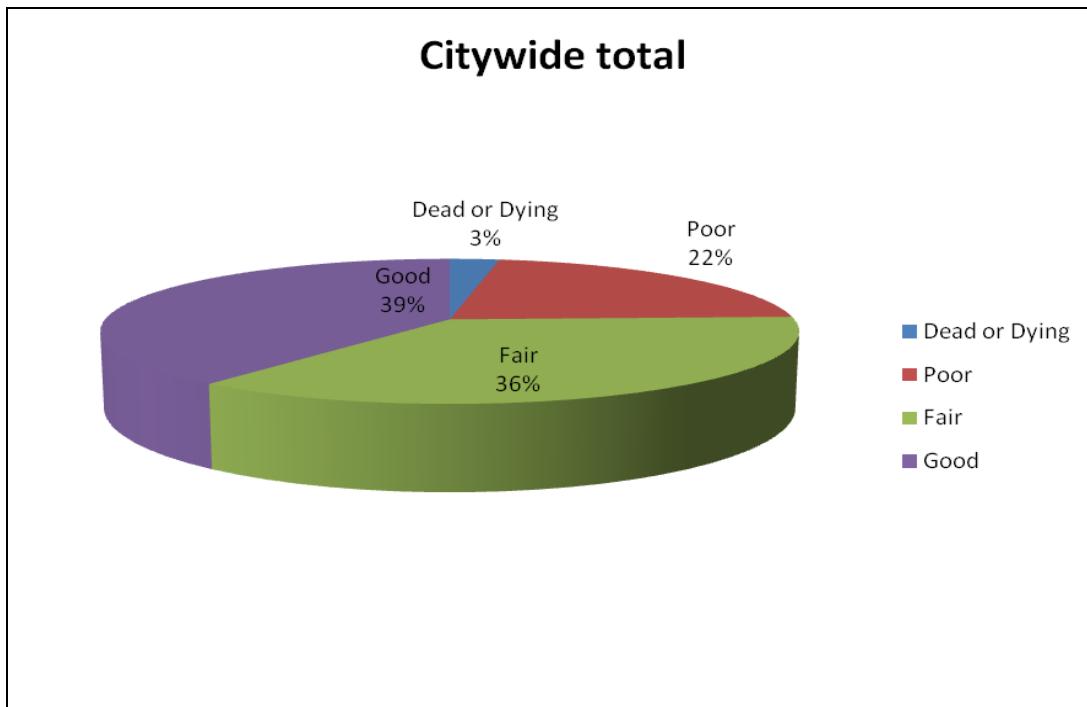

Poor trees were defined as trees that are in a general state of decline. They may have show severe mechanical, insect, or disease damage, but are not dead. Many tall growing species of tree that have been severely pruned over the years under utility lines were categorized as Poor due to the trees poor form and decay in the stems at old pruning cuts. Dead trees exhibited no signs of life.

Below you will find that 88% of the foliage in all trees inventoried was either in good condition or fair condition. Additionally you will find that 75% of the woody portion of the trees inventoried was either in good condition or fair condition.

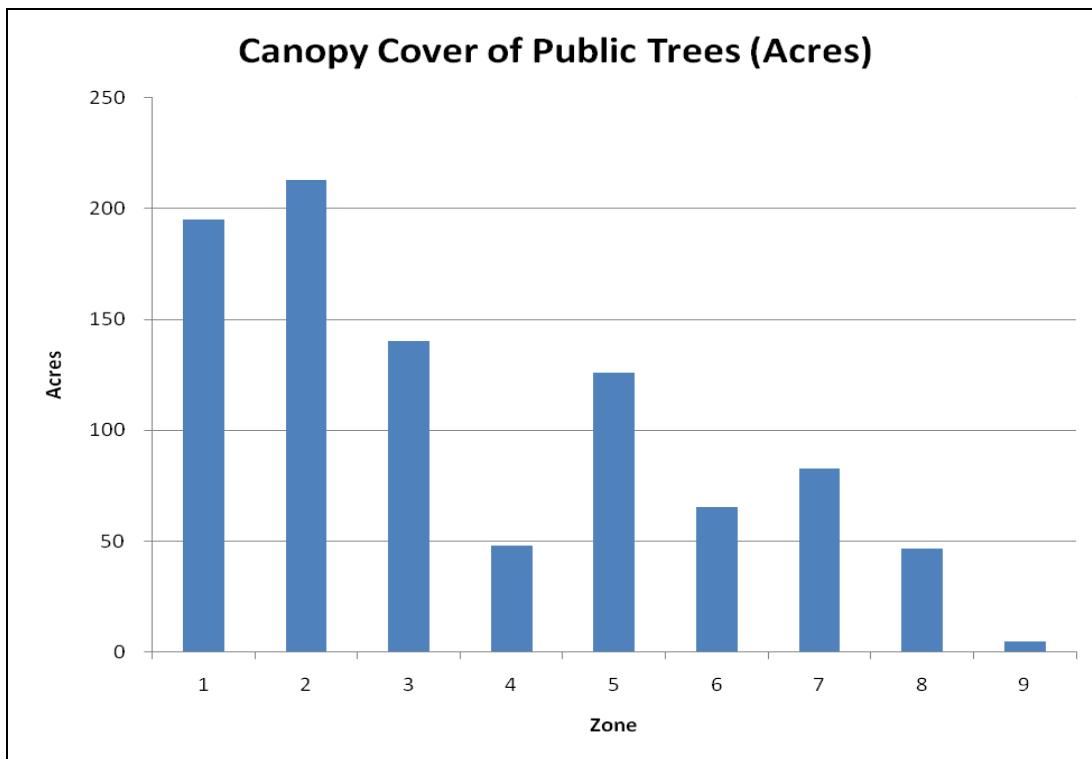

Total Citywide Condition (Foliage) of Public Trees (%)

Total Condition (Woody) of Public Trees (%)

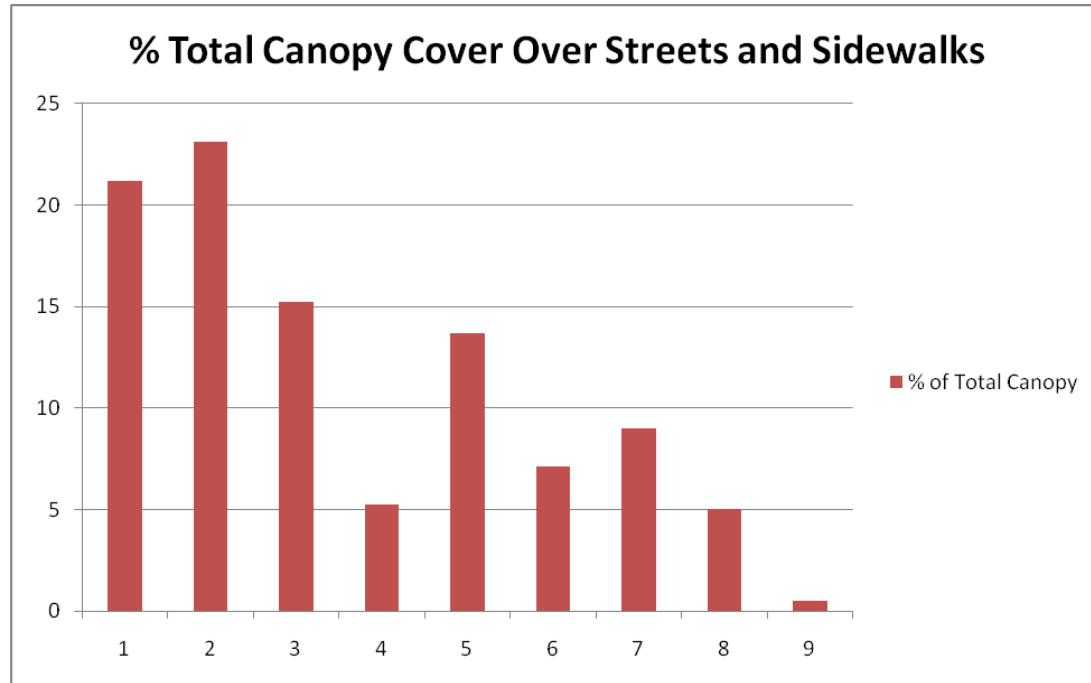

Canopy Cover:

Tree canopy cover, or more precisely, the amount and distribution of leaf area, is the driving force behind the urban forest's ability to produce benefits for the community. The following canopy cover percentages and total acres are for Street Trees only and do not account for trees on private property or

Parks. These Canopy Cover numbers were produced by STRATUM and are based on models and assumptions that are related to species and Diameter at Breast Height (DBH).

As canopy cover increases, so do the benefits afforded by leaf area: climate control and energy savings; improvement of air, soil, and water quality; mitigation of stormwater runoff; reduction of the greenhouse gas carbon dioxide; provision of wildlife habitat; and increased real estate value and community vitality.

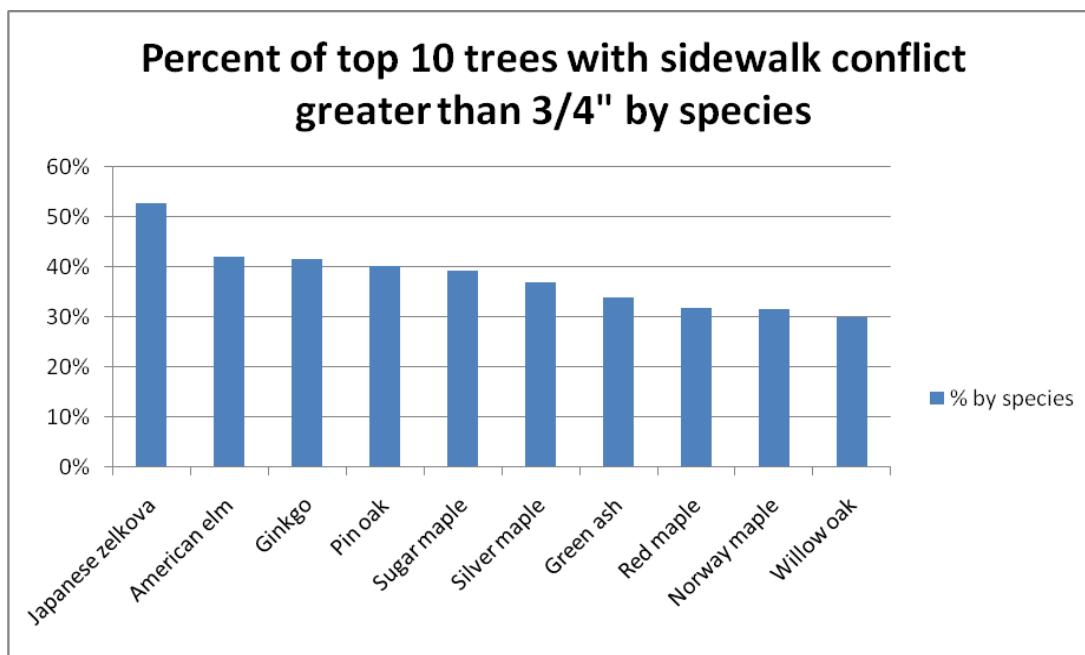

Management Costs:

Below assumptions were made from inventory numbers to help determine potential costs to maintain and/or plant trees. No assumptions were made on the repair or maintenance of sidewalk heaving that was observed during this inventory.

Description	Total Count	Estimated Cost/Item	Potential Cost
None	33,475	\$ -	\$ -
Plant	19,600	\$ 165.00	\$ 3,234,000.00
Young Prune	9,500	\$ 75.00	\$ 712,500.00
Mature Prune	14,250	\$ 480.00	\$ 6,840,000.00
Mature Prune (Priority)	125	\$ 480.00	\$ 60,000.00
Critical Concern		\$ -	\$ -
Scheduled Removal	1,125	\$ 1,200.00	\$ 1,350,000.00
Hazard Removal	125	\$ 1,200.00	\$ 150,000.00
Hazard Evaluation	1,950	\$ 50.00	\$ 97,500.00
Stump Grinding	1,650	\$ 270.00	\$ 445,500.00
Total Potential Cost			\$ 12,889,500.00

Since the Urban Forest is dynamic system impacts from weather conditions, pest problems or abiotic stresses can influence and determine the condition of the Forest. A complete inventory could create a clearer picture and create actual work orders to help address the tree related issues in the Urban Forest.

Sidewalk and Utility Conflicts:

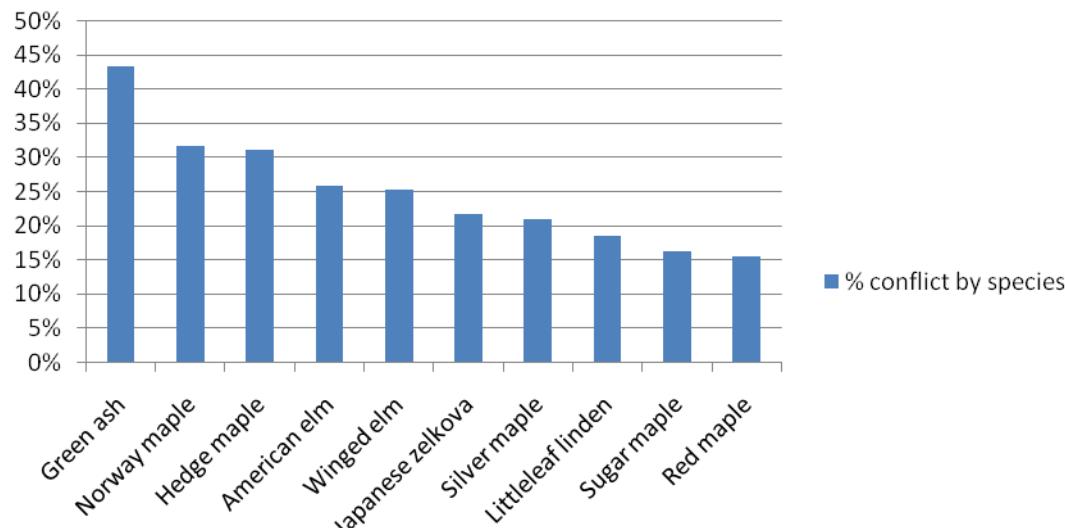

Sidewalk issues and trees is a common problem with many municipalities. If managed properly it would appear that the overall tree conditions would improve, mature trees would live longer and improve the relative age distribution throughout the City, increase canopy cover and associated benefits, and most importantly reduce removal, stump grinding and tree planting costs.

The chart above listed the top ten trees in order of having the most problems with sidewalks. This could be related to just mature not having enough room to grow in the locations they have been planted or it could be associated by the species of tree and their root growing characteristics. It appears from this data and my observations that Japanese Zelkova has an aggressive root system that cause many sidewalk problems.

Approximately 25% of all trees inventoried had a sidewalk heave greater than $\frac{3}{4}$ of an inch.

Percent of Top 10 Trees with Present Utility Conflict by Species

Utility issues and trees are difficult to deal with. Sometimes there could be as many of five contractors touching the same tree; Dominion Virginia Power cutting back from power lines, Department of Public Utilities cutting back from street lights and street light wires, Cable Contractors, Phone Contractors, and lastly Urban Forestry Division; all with different requirements and goals.

Most of the time there are two main entities working on the street trees, they are Dominion Virginia Power and the Urban Forestry Division. If Dominion could also remove dead, dying and diseased limbs and elevate over sidewalks, elevate over roads, and cut back from buildings while working on the trees, it could save the City from having to perform these tasks.

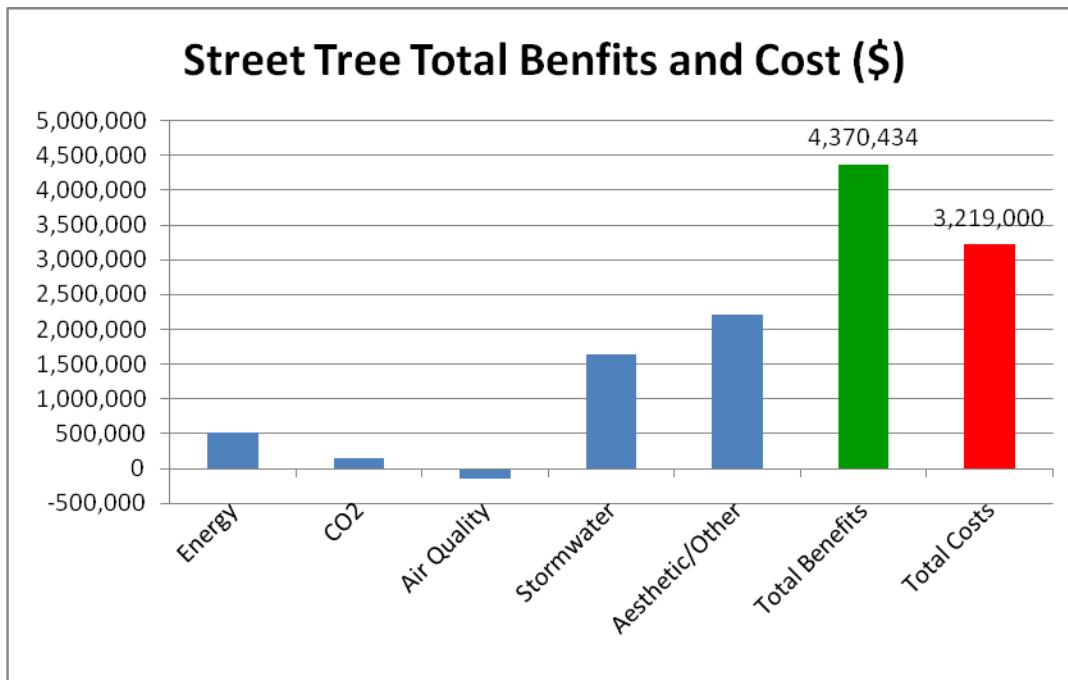

Utilities conflicts or potential conflicts were found on 28% of all trees inventoried; however, 72% had either no lines present (59%) above tree or no conflict with the wires (13%). This indicates that for 13% of the trees inventoried the right tree for that location was planted.

Tree Inventory Value:

Total Citywide Tree Inventory value: \$211,514,285.51. This is an estimate of the full costs of replacing the current street trees in their current condition, should they be removed for some reason. STRATUM follows the method in the Council of Tree and Landscape Appraisers Guide, 9th edition

Total Annual Benefits, Net Benefits, and Costs for Public Trees

Total Energy, CO₂, Air Quality, Stormwater, and Aesthetic benefits were calculated in STRATUM and are found in Appendix 34 through 45.

Benefit–Cost Ratio (BCR) for the City of Richmond Street Trees was 1.3576993. In STRATUM, the BCR represents the return on investment for the care of trees. For example, since the BCR = 1.3576993, then the city receives \$1.36 in benefits for every dollar spent on tree management annually—a 36% return on investment.

Total Benefits of street trees exceeds total management costs. The management costs also include indirect costs like litter clean-up and infrastructure repairs.

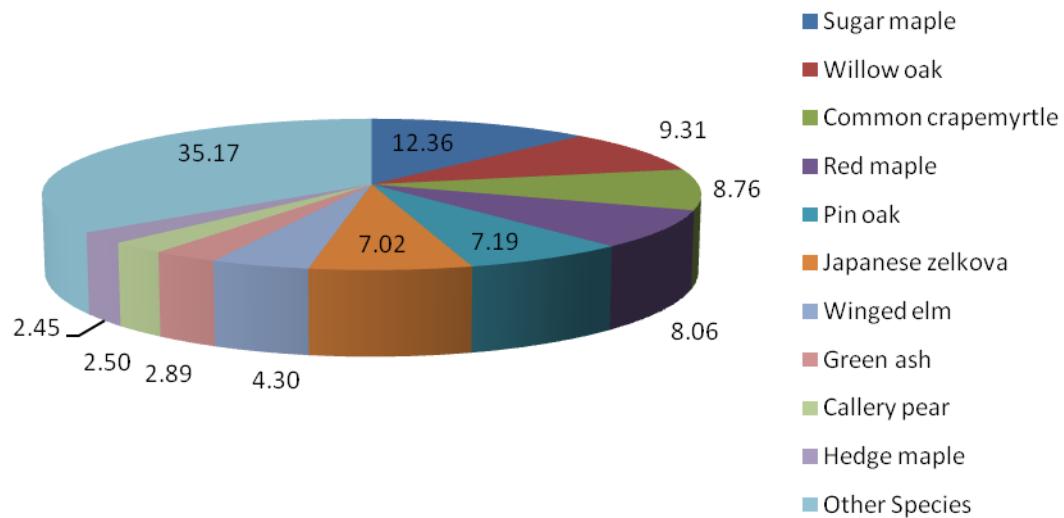

Appendix 1: Annual Management Costs of Public Trees

City of Richmond

Annual Management Costs of Public Trees

Expenditures	Total(\$)	\$/Tree	\$/Capita
Purchasing Trees and Planting	250,000.00	5.28	1.25
Contract Pruning	593,700.00	12.54	2.97
Pest Management	0.00	0.00	0.00
Irrigation	0.00	0.00	0.00
Removal	890,550.00	18.81	4.45
Administration	200,000.00	4.23	1.00
Inspection/Service	210,000.00	4.44	1.05
Infrastructure Repairs	560,000.00	11.83	2.80
Litter Clean-up	494,750.00	10.45	2.47
Liability/Claim	20,000.00	0.42	0.10
Other Cost	0.00	0.00	0.00
Total Expenditures	3,219,000.00	68.01	16.10

Appendix 2: Species Distribution

City of Richmond

Species Distribution of Public Trees (%)

Species	Percent
Sugar maple	12.36
Willow oak	9.31
Common crapemyrtle	8.76
Red maple	8.06

Asian Longhorned Beetle (*Anoplophora glabripennis*): A New Introduction

The Asian longhorned beetle (ALB) has been discovered attacking trees in the United States. Tunneling by beetle larvae girdles tree stems and branches. Repeated attacks lead to dieback of the tree crown and, eventually, death of the tree. ALB probably travelled to the United States inside solid wood packing material from China. The beetle has been intercepted at ports and found in warehouses throughout the United States.

This beetle is a serious pest in China, where it kills hardwood trees in roadside plantings, shelterbelts, and plantations. In the United States the beetle prefers maple species (*Acer spp.*), including *boxelder*, *Norway*, *red*, *silver*, and *sugar maples*. Other preferred hosts are *birches*, *Ohio buckeye*, *elms*, *horsechestnut*, and *willows*. Occasional to rare hosts include *ashes*, *European mountain ash*, *London planetree*, *mimosa*, and *poplars*. A complete list of host trees in the United States has not been determined.

Currently, the only effective means to eliminate ALB is to remove infested trees and destroy them by chipping or burning. To prevent further spread of the insect, quarantines are established to avoid transporting infested

trees and branches from the area. Early detection of infestations and rapid treatment response are crucial to successful eradication of the beetle.

The ALB has one generation per year. Adult beetles are usually present from July to October, but can be found later in the fall if temperatures are warm. Adults usually stay on the trees from which they emerged or they may disperse short distances to a new host to feed and reproduce. Each female usually lays 36-50 eggs during her lifetime. Some are capable of laying more than that. The eggs hatch in 10-15 days. The larvae feed under the bark in the living tissue of the tree for a period of time and then bore deep into the wood where they pupate. The adults emerge from pupation sites by boring a tunnel in the wood and creating a round exit hole in the tree.

For more information about Asian longhorned beetle in the United States, visit these U.S. Department of Agriculture Web sites:

www.na.fs.fed.us/fhp/alb/

www.aphis.usda.gov/plant_health/plant_pest_info/asian_lhb/index.shtml

If you suspect an Asian longhorned beetle infestation, please collect an adult beetle in a jar, place the jar in the freezer, and immediately notify any of these officials or offices in your State:

State Department of Agriculture:

- State Plant Regulatory Official
- State Entomologist

U.S. Department of Agriculture:

- Animal and Plant Health Inspection Service,
Plant Protection and Quarantine
- Forest Service

County Cooperative Extension Office

State Forester or Department of Natural Resources

Asian Longhorned Beetle

WHAT TO LOOK FOR:

1. Adult beetles. Individuals are $\frac{5}{8}$ to $1\frac{1}{2}$ inches long, with jet black body and mottled white spots on the back. The long antennae are $1\frac{1}{2}$ to $2\frac{1}{2}$ times the body length with distinctive black and white bands on each segment. The feet have a bluish tinge.

3. Oozing sap. In the summer, sap may flow from egg niches, especially on maple trees, as the larvae feed inside the tree.

5. Round holes, $\frac{3}{8}$ inch in diameter or larger, on the trunk and on branches. These exit holes are made by adult beetles as they emerge from the tree.

2. Oval to round pits in the bark. These egg-laying sites or niches are chewed out by the female beetle, and a single egg is deposited in each niche.

4. Accumulation of coarse sawdust around the base of infested trees, where branches meet the main stem, and where branches meet other branches. This sawdust is created by the beetle larvae as they bore into the main tree stem and branches.
